LAMINAR AIR FLOW CEILINGS
SINGLE SPEED / DOUBLE SPEED
The range of ATA laminar air flow ceilings ensures efficient protection against contamination which can occur during invasive acts and caused by airborne dead or living particles.

The ceilings are available in square, rectangular, octagonal or circular shapes in order to suit any room layout and answer specific requirements to create a clean zone around the patient, medical staff and medical devices. Our laminar flow ceilings are mainly used with our Clinicair Air Handling Unit, but can be also adapted to any type of products from a different brand.

This system is dedicated to operating theatres in order to meet ISO 5 standard (complying with EN ISO 14644-1) as well as to pharmaceutical industry. It helps fight cross contamination and hospital borne infections.

We have developed two ranges, in order to meet with all country regulations:
- NFS 90-351 Range:
  rectangular, square, octogonal ceilings (on demand)
- DIN 1946:
  rectangular, circular, octogonal ceilings

**ADVANTAGES**

- The ceilings are available in different shapes and meet with NFS90-351 – DIN 1946 European standards.
- Easy installation and filters replacement.
- Simple fixation system.
- Adaptable with all types of Air Handling Unit (see Clinicair range).

example: CLINICAIR® 3 with laminar air flow ceiling

Air speed: 0.25 m/s to 0.50 m/s
**TECHNICAL CHARACTERISTICS**

**NFS - 90 - 351 Range**

X horizontal filter integrated to LAF, air diffusion through metal grill or stretch fabric
*70 mm thickness for 350 mm height and above - initial pressure drop 100 Pa @ 0.25m/s
[] air diffusion through stretch fabric, sideway filtration

- Frame made of 15/10 electro galvanized metal sheet with epoxy RAL 9010 or stainless steel (AISI 304L or AISI 316L).
- Air diffusion through metal grill or stretch fabric.
- Lateral duct connections.
- H14 (HEPA) filtration (ULPA 15 optional).
- Metal lateral apron to stop induction (height 100 mm) with epoxy paint (transparent apron optional).
- Central passage for the surgical light.
- Pressure tap to measure pressure drop.
- Possibility to add the Bioxigen system: bactericide, fungicide, virucide action (option).

**DIN 1946 range**

- Metallic frame made of stainless steel aluminum with Epoxy Ral 9010 white paint.
- Air diffusion through double stretch fabric.
- Lateral duct connections.
- H13 (HEPA) filtration.
- Transparent anti-induction lateral apron.
- Central passage for the surgical light.
- Pressure tap to measure pressure drop.
- LED or standard lighting.
The requirements in terms of asepsis have strongly changed in the last few years. This is particularly due to the improvement of aeraulics techniques in general and to the improvement of components and air treatment installations. The criteria of operating room aeraulics equipment certification have therefore been adjusted consequently.

It is suggested to use a ventilation system of type unidirectional with a differential air flow rather than mixing turbulent ventilation.

The ultra-cleanliness of the air maintains guaranteed even if the medical team bends over the patient or move inside or outside the protected area.

The results obtained during particle counting measurements near the wound are, in terms of asepsis, far better with a differential air flow than with turbulent ventilation.
To respond to the recommendations made by Lucerne University of Applied Sciences, in Switzerland, ATA has developed a new generation of double speed laminar air flow ceilings for the certification of operating rooms according to SICC 99-3 standards.

It is a vertical laminar air flow ceiling that ensures a level ISO 5, according to EN ISO 14 644, in the room (surgeries of high aseptic level, orthopedics for example).

The diffusion plenum is made of 15/10 electro galvanized metal sheet with white epoxy paint or stainless steel strictly airtight, and is equipped with air filters of type H14 (efficiency greater than 99.995% according to EN 1822). It is equipped with an anti-induction lateral apron that enables to eliminate almost completely the penetration of airborne particles (in particular via the swivel arms).

Possibility to set the speed of air diffusion (from 0.25 to 0.50 m/s) in 2 distinct zones (central and peripheral) which improves the working comfort of medical staff (for long duration surgeries), reduces the penetration of airborne bio contamination in the protected area, and enables the evacuation of smokes emitted during surgeries.
WORKING PRINCIPLE

Air speed: 0.25 m/s
Air speed: 0.50 m/s
Air intake
• Tow air flow speeds possible: between 0.25 and 0.50 m/s
• Pressure loss between 8 and 25 mm CE
• Air supply via double stretched fabric
• Air intake at the end of the ceiling via two separate adjustment dampers of the two supply zones
• LED lighting integrated behind the stretched fabric
• Fastening tab at the ceiling via threaded rods.
• DOP socket to measure pressure drop for filter clogging control
• Lighting by LED (IP65) is optional (adjustable) (24 Volt)
• 12 x LAMAIR filters H14 of 610 x 1220 x 70 mm
• Filtration media in glass-fiber paper
• Protection metallic grille with Epoxy paint
• Aluminum frame with seal at air supply
• Efficiency 99.999% DOP
• Dimensions: 3342 x 3342 x 500 mm.
In order to obtain suitable air quality it is important to take into account the specifities of the area and the objectives in terms of particulate and bacteriological cleanliness class, and to define the following parameters:

- Air diffusion method,
- Filtration efficiency,
- Air flow rates and conditions (temperature and humidity) at the air supply, air intake, fresh air and outgoing air,
- Noise level allowing users to work in comfortable conditions.

Despite the fact that various individual approaches exist as to the choice of air handling units to be installed, everyone agrees that only the performant “hygienic” equipment will be efficient in eradication of microorganisms (bacteria, viruses, mold, yeast...) using inert air particles to move around and develop.

ATA is an Expert in Air Quality who will provide you with:

- an objective recommendation as to the solution to implement,
- a strong commitment to select performant hygienic equipment,
- an assistance of a qualified technician in equipment commissioning,
- a technical training (ATA is an approved training center),
- a remote assistance to provide problem-free operation.
